

ABSTRACT OF THE DISCLOSURE

An electronic device includes first and second housings which are pivoted to each other, and a spring-biased stopper mounted movably on an upper wall of the first housing. The stopper is movable in a transverse direction relative to the upper wall between an engaging position, in which the stopper projects outwardly of the first housing through the upper wall and engages the second housing, and a second position, in which the stopper is received in the first housing and disengages from the second housing.
